Dear Jakob

If your application is interactive, I would not unlink Scatter from data. That is the nice thing of having all coupled.
In case that you need, for any case, to unlink them, SetDataSourceInternal() does the job just once after all AddSeries() calls.

In addition, if your user updates the data, you would have to call Refresh(). If you unlink the data, you would have to call SetDataSourceInternal(), so this does not require additional lines of code.
