I have no idea why this was here and it is useless (just checked, it's been around for years 6.5 years LOL), I am removing it from the code base

Ah that works, too wasy LOL! And somewhere in your code I've even seen a date in 2012! Codes never age isn't it, they are evergreen :d

For the rest, if you send me the code of you're GanttCtrl (and only that) it would be easier

Uploading my code. I have CustomData and CustomDataSource in the same file. You will see there are some dependencies.

```
bool IsHoliday(Date)
```

this determines if that date is holiday or not (2nd or 4th Sat and Sun and declared holidays). you may plan to replace this with a callback maybe.

Other dependencies I'll explain if you need.

One suggestion:

CustomData::Intersects and CustomData::Contains deal with bounding box of the data point. In some situations the bounding box depends on screen coordinates, please consider this.
