I have no idea why this was here and it is useless (just checked, it's been around for years 6.5 years LOL), I am removing it from the code base

Ah that works, too wasy LOL! And somewhere in your code I've even seen a date in 2012! Codes never age isn't it, they are evergreen :d

For the rest, if you send me the code of you're GanttCtrl (and only that) it would be easier

Uploading my code. I have CustomData and CustomDataSource in the same file. You will see there are some dependencies.

bool IsHoliday(Date)

this determines if that date is holiday or not (2nd or 4th Sat and Sun and declared holidays). you may plan to replace this with a callback maybe.

Other dependencies I'll explain if you need.

One suggestion:

CustomData::Intersects and CustomData::Contains deal with bounding box of the data point. In some situations the bounding box depends on screen coordinates, please consider this.
