Hello,

It seems that there is a bug in makefile generation algorithm. It doesn't detect operating system (assumes POSIX=LINUX) and ignore our internal settings.

This issue can be only fixed by Mirek. Right now you could manipulate makefile and replace "-ldl -lrt" with "-execinfo". Here is our library matrix for operating systems for Core package:

After building TheIDE it should run smoothly on OpenBSD. However, please build by replacing libraries and let us know what is the status. Thanks!

Sincerely,
Klugier
