OK

Then, he is correct to use the destructor to make this type of things?

```
class someThing : public TopWindow
{
    MySqlSession mySql ;
    someThing()
    {
        mySql.Connect(.....) ;
    }
    virtual ~someThing()
    {
        mySql.Close() ;
    }
}
```

I believe that still I have Windows mentality and I do not finish thinking that can do this and be to me so calm, but in fact works.

UPP is great

Nico
