Thanks.

One little annoying thing is that if all packages are already installed and pkg takes no action, it returns exit code 4 and install script reports problem. Any chance to fix that without introducing some mechanism of "allowed exit code" into install script? Like some pkg commandline option?

Other issue is that while testing our examples, there seems to be some issue with socket implementation; in OpenIndiana I am getting some socket transport endpoint errors; it works fine on other platforms. Does that ring some bells?
