Dear normvcr

Your Build methods dialog seems to be right, and apparently your install is correct.
I would advice you first to compile some demos. You can choose any going to File/Open main package/examples, choosing one of the packages and compiling it.
As Xemuth explained, U++ structure is through packages, any U++ library is a package, a package can include more packages, and the main application is also a package.
If you feel you need more support you can ask in our Tutoring plan, that is totally free.
