Subject: Re: Application crashes and OS instability can overwrite the currently edited file with junk
Posted by jjacksonRIAB on Wed, 19 Aug 2020 12:43:14 GMT

I suppose what I'm getting at is this: if you write a bad application and run it does theide fork a child process that could access the parent's memory (in this case, the currently open file) and overwrite it with junk which would then be written to the filesystem once theide has focus again?
