I converted the deb package to rpm using alien (contained in SUSE distribution) and it installed and worked without any problems. The commands are:

alien --to-rpm --keep-version upp_608-dev-1_i386.deb

followed by:

rpm -ivh upp. . . . . .rpm

take care to list the directory before the rpm command because alien makes small changes to the package name which are easily overlooked.

Hope this helps someone.

Regards
Richard
