koldo wrote on Mon, 14 September 2020 17:06When reading this post I was thinking in these CLANG warnings that seem unavoidable. Warnings like this are the reason why I found this proposal interesting:

Why don't you just fix it? CLANG warns you that the case does not match... Basically, if you use something like

```
#include <core/core.h>
```

then this will work in Win32 (with warning), but will NOT work in POSIX....
