Subject: Program changing column

I have sqlarray, and wish to either have (ID, "ID") or (NAME, "Name") dependent upon checkbox.

I have figured out some code to tell when option changes state:

```
anon.WhenAction << THISBACK(anonChanged);
.
.
.
void TaxWindow::anonChanged()
{
 if (anon.Get() == 1) // s/b 1 = true/checked, 0 for unchecked I believe
  // use Number
  return;
 else // use name
  return;
}
```

But am at a complete loss how best (or even just how) to accomplish this? Ultimately, will use AsQTF to output a table from array...

Thank you!

Jim
