I'm still working on this, but so far all I've come up with is to change column widths to "cover up" unwanted column:

```
void TaxWindow::anonChanged()
{
    if (anon.Get() == 1) {
        // use cust Number
        sqlTaxReport.ColumnWidths("150 200 [u]65 1[/u] 150 150 150 200 200");
        return;
    }
    else { // use cust name
        sqlTaxReport.ColumnWidths("150 200 [u]1 140[/u] 150 150 150 200 200");
        return;
    }
}
```

I'm probably going to eliminate the array altogether, though, once I figure out the way to use `repgen` (or an alternative) with the current stable build...
