If we want that the pages of a TabCtrl completely occupy the space defined by the function TabCtrl::GetOpaqueRect(), we can use this simple piece of code.

```
void FillTabPage( Ctrl& c, TabCtrl& tab )
{
    Ctrl::Logc lHorz, lVert ;
    lHorz.SetAlign(ALIGN_CENTER) ;
    lVert.SetAlign(ALIGN_CENTER) ;
    c.SetPos( Ctrl::LogPos(lHorz, lVert) );
}
```

I am using it in my present development and is very well!

Example of use:

```
....
tab.Add(listDefinitionPage, t_("List definition") ) ;
tab.Add(listDataPage, t_("Addresses and data") ) ;
tab.Add(messagePage, t_("Message's body") ) ;

FillTabPage(listDefinitionPage, tab ) ;
FillTabPage(listDataPage, tab ) ;
FillTabPage(messagePage, tab ) ;
....
```

In the Image, left Window use FillTabPage, the right window don't use it.

Nico
