Yet another example, how are you going to fix this:

```
double SomeFunction(double x)
{
    return ln(x*x*x - 15*x*x + x + 20);
}
```

Now this function is used throughout your code on 50 places and you have got an exception because the argument is negative.

How are you going to fix it?

This is the main problem I have encountered with "activate FP exception" approach and I still do not know the correct solution....
