Klugier wrote on Sat, 31 October 2020 11:18 Without the code it will be difficult to diagnose what is causing the problem.

well... it can take time... I just saw such variable in debugger (with multiple FreeFreeFree...) when I had a memory leak... the first question is just about - does it really mean that the memory is being allocated, but not freed?..

p.s.

to extract a piece of code will be really not so easy - will took time... I will see...

just I saw some preventions in forum, that openssl sometimes gives memory leaks when working in MT-environment (in my case in secondary thread, though when I do loop in main-gui-thread - no problems - already was tested)...

- if this problem can occur in v.13664-32x-windows or it depends on compiler (mingw or MSVC)?.. - I'm not sure, that the whole code is needed - especially if I'm restricted in using just last 32x-version of U++ in windows with mingw-compiler (optimized to 9.3 version in Build_Method_Settings & I've got away everything else that was there - perhaps I've lost something important?)
