Hello,

Did you try to debug memory leaks? It will show you exactly in which place the leak is. The all information about detecting memory leaks and marking false positives you can find here.

Please noticed that today I updated this article significantly, so not all information will be there. Visit this site tomorrow and all new information should be there. Alternatively you could update to the latest SVN version and read new documentation page inside TheIDE or just read the raw data in commit content available on GitHub (Click on Load Diff for obtaining content).

Klugier
