I also saw following hack in the code:

String CurrentNamespace; // this is ugly hack, but better than rewrite everything

The whole file when the function is used is relatively simply, so why not just extract class and put current namespace as variable? Should be easy and we will have better/cleaner (easier to maintain) code in that place.

Klugier

Would need to redesign about 1000 lines of code. Not really worth it in this case.

Mirek
