Well, what information from git would you want? branch? hash?

Mirek

Everything for each used component.

I usually store this info with app to be able to recall what was used to build this app.

I am afraid "everything" is a bit generic term for me. Would you care to e.g. show me the example?

At least name of a component, URI, and all other attributes presented in supported VCS, like branch (not sure about branches in SVN), hash is also not a generic property, revision ID (specific to SVN and Mercurial, I guess).

The way I'd like to use it is in a form of an X-macro like in an example below.

```
struct VAR : adt::PropMap<String, String>, Empty {
```

```
#define LIST_OF_MEMBERS \
```

```
  X(UPP) \
```

```
  X(OUTPUT)
```

```
VAR ()
```

```
: Empty()
```

```
#define X(name) , name(map, #name)
```

```
  LIST_OF_MEMBERS
```

```
#undef X
```

```
{}
```

```
#define X(name) Prop name;
```

```
  LIST_OF_MEMBERS
```

```
#undef X
```

```
#undef LIST_OF_MEMBERS
```

```
}; // VAR
```

Basically, I'd like to get a LIST_OF_COMPONENTS define.
