Hello Mirek,

I obtains following error when trying to download UppHub package:

The problem here is that ssh access to git requires additional configuration. In our case when ssh failed we should reswitch to http and clone using following command:

git clone https://github.com/mirek-fidler/urr.git

Also, I think https way is much more safer as default clone strategy rather than ssh as it doesn't require any additional configuration. We could also think about adding ssh fail-back if https failed.
