Well now the debugger launches, and if I set a break point it locks up the entire Ubuntu Desktop. The only thing that works while an Ultimate++ app is open in the debugger is the CTRL+TAB function. If I have a terminal open I can CTRL+TAB to the terminal find the process being debugged and kill it on the command line. But what I can't do is step through code that is stopped at a breakpoints because the application or the modal dialog seems to be capturing all events.
