Hi,

This is probably not qtf-designer specific but I've encountered it while I was trying table stuff.
Hence the title.

It is always reproducible.

How to reproduce:

Paste the below qtf (which is taken from the qtf doc examples section) to qtf designer:

{{1:1:1|2 A1::-2 A2:: A3:: B1:: B2:: B3}}

Then manually change it to the following, in the designer:

{{1:1:1|2;h3 A1::-2 A2:: A3:: B1:: B2:: B3}}
        --
        ^^

TheIDE will crash with invalid memory access.

Now, this happens for h value < 0 || h value >= 3.

Tested on Linux/GCC/CLANG

Best regards,
Oblivion
