is it possible to execute javascript function together or just after the U++ "ajax" event?

how to make a javascript function fired right after the event below?

```
SKYLARK(Add, "add:POST")
{
    String r = AsString(Nvl(http.Int("number1")) + Nvl(http.Int("number2")));

    http.Ux("result", "The result is: " + r)
        .UxSet("number1", r);

}
```

it would be something like the routine below ...

```
//or in the html page...
<script>
function myFunction() {
    'UxPost($Add, "numbers");
    alert("ok");
    ....
}
</script>
```

I tried to create an onchange event for any field but in this ajax, it is not triggered.

thanks
