Hello Mirek,

Quote:are you sure you want to go there wrt login? I mean, originally I planned that login mechanism will be left to be implemented by client in some web language (or Skylark).

The thing is I didn't know the original design decisions and the prospect for the Turtle package, until now. :)

So I assumed that it is expected to be implemented. This is actually a good news and a reasonable approach.

I have no objections to less work on my side. :d Thus what I'd like to do now is document the simple wire protocol and add a better description to README.

As a side note: I already implemented a proof-of-concept Turtle-protocol based VirtualGui/SshGui (as ssh2 sub-system, using our SSH package) that effectively solves the security/login problem for U++ remote frontend.

And implemented a simple TurtleCtrl prototype that works with both html/ws and this ssh2 backends.

Best regards,
Oblivion
