I am on Windows only. My 5 tries using Linux failed for me. Not my philosophy.

I am in Germany. The cheap Hardware I buy comes always with Win10x64pro, can't change this.

I know, the manufacturers pay so 25 bucks to MS. But so everything works out of the box.

I have my tools and I am writing my own ide, but not for C++ and not ready to publish.

And I do not use upp for it.

I like Thelde for C++. When I unpack upp.7z, I open it, go in the upp-directory and copy everything but -bin-. The contents of bin, is worthless for me. The remaining size is OK.

For my MSBuildTools it is good. Using macros I can build my some C and ASM when I need.

Best for everyone ,UHu
