Novo wrote on Tue, 12 January 2021 03:14: It would be great to add code below to packages Turtle and Skylark:

```
#ifdef flagMAIN  
CONSOLE_APP_MAIN {  
}  
#endif
```

That would allow me to build repos Turtle and Skylark fully automatically.

TIA

Is this a good idea?

I mean I understand you cannot compile without it, but in that case maybe you should just ignore non-main packages - compiling examples should do.

Or alternatively, you can detect non-main package and simply generate a project with empty CONSOLE\_APP\_MAIN and using the package you are testing.

Last alternative is to put something like above to the Core.

Putting it to every single package out there seems ugly.
