Klugier wrote on Sun, 24 January 2021 14:06Hello Luigi,

For curiosity, I just checked your app Vega (Vega) on macOS 11.1 and everything works fine (no crash at launch). So, the application doesn't link with OpenSSL and the problem doesn't exist. The same is true for VegaTeam.

You should be very careful with migration. First, we need to make sure that app with OpenSSL works well across different macOS versions. Now, TheIDE only works if you compile it manually with embedded umk with changes to build method.

Klugier

Hello Klugier,

thanks a lot for the news about my app on macOS 11. I was unaware of it. Actually I linked OpenSSL statically . I described somewhere on the forum how I did it. I compiled it with Mojave but I do not remember which version I used. I linked statically even mysqlclient. Each time I setup the machine for macOS I have a headache. Instead I was able to compile the same apps you tried under Raspberry in a much simpler ways. For the time being I'll continue to maintain my current setup on macOS.

Best regards,
Luigi
