If I open a window using `OpenMain /Open`, it will end up create a new window. I need a way to link my newly created "Tray Window" to windows created by `TopWindow`.

I am now still puzzling on how to cast my own version of "Tray Window" to become a real `TopWindow`. I need something like

`GtkEventBox`

`GtkEventBox` — A widget used to catch events for widgets which do not have their own window
