Subject: Help to setup U++ on vs code.
Posted by jeffinpqsim on Thu, 11 Feb 2021 06:55:15 GMT

Hello, someone here have tried upp in vs code with make, gcc, etc?
I am tying but without success...

G++ generate hundreds of errors from upp source.

I've tried to compile the core library on theide first and later use the library on vs code (but the errors persist!)

I think a big problem is because the include files has alot of implementation and inlines.
wich the compiler are trying to compile and these are generating hundreds of of errors.

if the include files (*.h) was used only for definitions, they will not generate that much errors because my projects it will only link with the actual precompiled library.

One detail is that compiling with gcc works inside theide, but i don't know how because theide doen't have a good log of the building steps.

if someone could help me, sharing me one makefile sample, build steps, configs, etc... I would appreciate.

Thank u very much in advance.
