I can handle the history, maybe disable unsupported tilt, no so sure about barrel...

About the barrel on Linux: Now with wacom it goes directly to right mouse button (with pen flag active though). I guess for uniform behavior the two options are now:

1. To catch in Linux RightDown() and RightUp() with IsPointerPen() and set the barrel flag accordingly.
2. Or to catch barrel flag in Windows WM_POINTERDOWN / WM_POINTERUP and call RightDown() / RightUp() accordingly on state changes with correctly set up IsPointerPen() result.

I do not know, which one would be more logical and better in line with general pen experience expectations. Or should we do both?

Best regards,

Tom
