Yesss, I had started working in that line! Thanks a lot Mirek!

I think you meant to measure the width, not height, with `GetWidth()`, I've seen this works! I'm planning to measure the width of the intended ellipsis character as well and shorten the text and add the ellipsis to fit in the cell width. It will suffice as long as it works, needn't be too elegant :d

But how to implement the binary search with `log(len(text))` (which I think will save few iterations)?
