Hello, I just get a macbookpro computer and very newbie to macOs.
I find that upp now support macos and want to have a try upp on macos.
With the upp's macos build downloaded, I extract the xz archive and run theIde application.
After requesting several permissions it comes up with a dialog to fetch source code from svn repository, which I never met when run it on Windows.
Selecting the matched version of upp, it popups with a dialog with a commandline show on it, but doing nothing.

I have checked that the svn command runs in terminal. I have also checked that uppsrc folder does exists.
I don't know where to start with, ending with this thread posted in forum for help :blush:

The attachment is what happened in the macbookpro computer when I run theIde.
The system version is macos big sur 11.2.2, in simpified chinese.
