## Subject: Re: EditTime - Is it possible to change displayed format?
Posted by mirek on Mon, 09 Jan 2006 19:13:28 GMT

::Format(Time(q))

- q is converted to Time and global Format(const Time&) is called.

However, this "standard" Format is a little but misleading in this case, as what you will really need is Format just for one type (Time). So it might more likely look like this:

```
Value  MyTimeConvert::Format(const Value& q) const {
    Time tm = q;
    return ::Format("%d:%d:%d", tm.hour, tm.minute, tm.second);
}
```

Note that this Convert would crash (or fail the assert in debug mode) if Value non-convertible to Time is passed, but that is OK in this case (you are going to use it just for Time anyway).
