The problem may be that the files in folder "resolv" is in normal (or old) C, and the includes <Core/Core.h> is a C++ files. The linkage and compile mode is very much different.

See the declaration of get\_mail\_server function

```
extern "C" const char *get_mail_server( const char *remote );
```

I believe that the RTTI cannot be qualified if we compiled in pure C.

But, what is and why you need unistd.h?

Nico
