To speak more about a UppHub package that requires external dependencies like a possible Vulkan one. It's, most of the time (not always), possible that the build method needs to be modified to include those external dependencies. IMO, having a single package modifying the actual build method is a bad way of working. However, maybe it could be possible to add a way to import the build method from a UppHUB repository. At the time you download a package like VulkanCtrl, TheIDE asks you if you want to import a custom build method that comes with this package. What do you think about this idea Mirek ?
