Hello,

I don't know U ++. I work with Lazarus and Qt and sometimes FireMonkey. My compilation targets
are windows 64, linux 64 and mac OS Intel and ARM. I need 3 specificities that are essential for
my developments :

 - statically linked access to MariaDB [I do not distribute mariadB libraries]
 - management and display of HTML in grids [arrayCtrl?]
 - generation of pdf documents from project code

Do theIDE and U ++ allow this ?
Thank you. Regards. Gilles
