Hello,

Is there a way to take a project that is being developed in "TheIDE" on one OS (e.g. macOS) and copy all of its settings, current state/session with opened files, and various configurations (build settings, key binds, etc.) over to another instance of "TheIDE" on another OS (e.g. Windows)? Is there an export process or procedure of some sort to use for preparing the files to copy over? I believe the paths would need to be fixed / normalized but I am not 100% sure how the paths are loaded into "TheIDE" during the open package process. Also, all of the ".cfg" files In the "cfg" folder of any UPP installation are binary (or some specific unknown format to me) so I am not able to edit them or modify them in any useful way (apparently my editing & hex editing skills are not strong enough ... for some reason).

Any insights or advice would be appreciated.

Please and thanks,
Matt
