Another issue: When calling ToUtf16(const char *s) with s=0, it crashes. (This does work correctly with 2021.1, i.e. without crashes.)

Here's the place in Core/Charset.h:

```
inline Vector<char16> ToUtf16(const char *s)      { return ToUtf16(s, (int)strlen(s)); }
```

It would work with:

```
inline Vector<char16> ToUtf16(const char *s)      { return ToUtf16(s, s?(int)strlen(s):0); }
```

Best regards,

Tom
