Subject: [Question] Is compiling TheIDE as a 32-Bit Binary still supported?

Hello.

Is anyone(TM) still compiling "TheIDE" (when building from the Archive) AKA "IDE" (when building from Git Source) as a X86 Binary under any Operating System?

I am currently creating some Scripts to compile "theide" etc. from Git Source. Which works fine on Manjaro KDE X86_64.

When I try to compile it as a X86 Binary with "-m32", I run into an Assert with GCC 11.2 - but that is an old Bug which was never fully fixed.

Anyway, while trying to work-around this old Bug, I was wondering if building the UPP Tools in X86 mode is supported at all these days!? If not, I can stop wasting my time.

Thanks in advance!
Olli
