the inner ~ is

DropList::operator ~

which inherits

Value Ctrl::operator ~()(maybe const modifier?)

the outer ~ is

String Value::operator~()(const modifier?)

the * cause a auto type cast be called

String::operatr const char *()(modifier?);

and then dereference of the returned constant char * returns the first char in the String.

something like

Value t1=~dl;

String t2=~t1;

const char* t3=(const char*)t2;

char t4=*t3;

if(t3=='\$')
