That results in mixing colored and B&W emojis. While technically probably more correct, should in case I am looking for emoji glyph always prioritize Noto Color Emoji (or maybe any color emoji font) over matching appearance of font?

Mirek

Hi,

Prioritizing color emoji would give the most consistent user experience on any desktop environment.

Best regards,

Tom

A bit of issue is that Win32 does not support color emoji in GDI as of now. We would need to go Direct2D or something to do that. At least use Direct2D to extract those pictures.

(And yes, in general, I think it might be the time to move from GDI, but I do not want to do that now.)
