Hello,

I see you are using makefile to build TheIDE. Could you try to install with ./install script (make sure you satisfied build requirements):

klugier@X470Pro:Dokumenty/upp \$./install

Following command should be used to install required packages:

```
sudo pacman -Sy --needed gcc make zlib bzip2 gtk3 libnotify openssl clang pkgconfig gdb
```

Install script can run this command for you, but that will require your sudo password.

Do you want the script to do that (Y/n)?n // <- You could run it if you want (I skipped, because I have all dependencies)

Please make sure that build dependencies are satisfied.

Continue (Y/n)?

Use prebuilt binary umks32 to accelerate the build (Y/n)?Y

Also use prebuild umk32 in order to build TheIDE.

I downloaded last nightly 16138 from our site and compiled it on Linux (Manjaro KDE x64).

Everything works fine. Could you also provide information about your distribution and architecture.

Klugier
