Actually, this is quite hard to fix, this is the result of "true wysiwyg".

The problem is that RichEdit (and RichText in this mode) are printing the text by downscaling it from its physical (printer) appearance. This inevitably leads to "uneven" layout of characters (it could be in theory resolved by subpixel resolution, but that would make the text blurry, which is even worse I think).

Hm, maybe keeping "pixel" distances for words and fix them at spaces.... I will think about it.

(Just a note: Both MS Word and OpenOffice Writer share exactly the same problem. If you are doing wysiwyg, some characters will be one pixel off their ideal positions for given zoom factor).

Alt-Backspace was added on Tuesday (I think). Sync uvs
