Subject: SQL - option for real case of column/table/database names

Hi,

I decided to write database management app in Upp but the requirement is to have real case names of columns, tables and databases.
Subject of not forced uppercase names in SQL was already mentioned in several posts but without any action for implementation.

Easy way to implement this is to add global option to SQL session.
Mirek, can you suggest the name for that option, where and how it should be assigned and accessed following your coding standards.

Thanks,
Michael
