Now thinking about it, maybe the problem is that the file is locked for writing while being compiled?

Mirek

I don't know if this bit of information helps or not but when it this problem occurs it's also clearing the undo buffer so you can't go either forwards or backwards. Could it be related to when undo buffer is full and it's ejecting the oldest entries?

Well, clearing undo buffer is done when the file changes outside theide, that is actually a good thing (theide looses the track of chnages so cannot do undo). Maybe the problem is that this sometimes does not happen even if it should.

EDIT: Actually, I did not have this rare problem (I mean original one) for about a year (using theide for many hours each day) and I remember fixing some things around it, so maybe it is finally fixed.
