Subject: FileSel takes quite a lot of CPU on Windows Posted by Tom1 on Fri, 22 Apr 2022 21:32:56 GMT

Hi,

Using FileSel (e.g. FileSel::ExecuteOpen()) takes a whole lot of CPU cycles on the background and it continues to dominate one CPU core for about half a minute after opening the FileSel dialog. This is on Windows. No such issue on Linux. You can see it on the Windows Task Manager by observing CPU usage (of e.g. UWord) when opening a file using FileSel. I looked back and noticed that this was already present in 2021.1 and remains there in 2022.1rc3.

Best regards,

Tom
