Not sure what do you mean with IsVoid problem, piece of code maybe?
OK, I found the reason causing part of my testing issues:
```
if(String::GetVoid().IsVoid()) Cout() << "String::GetVoid().IsVoid() works!\n";
else Cout() << "String::GetVoid().IsVoid() fails!\n";
if(IsVoid(String::GetVoid())) Cout() << "IsVoid(String::GetVoid()) works!\n";
else Cout() << "IsVoid(String::GetVoid()) fails!\n";
```

Best regards,

Tom

EDIT: Improved test code.

Uhm, that is actually API problem:

IsVoid(const Value&) function is about Value - it tells you that Value was not assigned anything. In above example you assign it a String, so it must return false.

I agree this is a bit confusing, but I am not sure there is a solution to that.
