I think that at least Serial and Sound(wrapped PortAudio soundsystem+plugin/wav) should go into plugin or core packages, since they are fundamentals. Serial code won't change in the future, and probably neither PortAudio, so maintaining code is not an issue, copy/paste packages to core would be fine.

Of course, i have made copies of bazaar archive, just in case you'll be stubborn :). Personally, i prefer main up-download to be as small as possible, without bazaar and git, but bazaar and/or github as an option. Upphub may be a plus for some situations and of course - it could be a handy option and probably "flatten out" newVers differences between bazaar and up bugs. If one is eager for upphub thing, then one could probably create converter from bazaar to upphub, and mark/review packages as fullyFunctional or unmaintained, etc. If this is started: from my experience - Serial and Sound are fully functional. SoundExample code is also there and functional albeit for blocking mode. Streamed mode is from my experience fully functional also.

The same goes for FontSel that was proposed soooo many times but not integrated into core(uppsrc/CtrlLib), all is there only this is lacking for dialogs(colorchooser, FileSel, etc) to be complete. FontSel code was written by someone else - but i think i changed it a bit some time ago, anyhow - it's attached(if integrated - only check/correct FontSel.h and FSel.cpp header paths - 2linesOfCode).

What about GLDraw and GLCtrl - core of this topic?

This are also fundamentals..

It's a simple correction for one that knows how underlying code should work.
