Thanks for your work. I compiled it.
It is not so slow, quite usable on an ancient i7.

I can see two problems now:

In AddressBook example, in a method of AddressBook class, if I type a member's name and a dot, it doesn't see the member's members. It is OK on local/global variables or arguments. Is this because of that template "feature"?

An other thing is, that Help's history is buggy. It works only, if the topic has internal links with labels (e.g. TheIDE help / Build flags).

Cross references and clicking on tree items are not going into history (e.g. Used packages / Core / ArrayMap, and you click to a cross link, such as AMap or moveable). (I think, this bug is since implementing label handling in topic links.)

Edit:

My system is Ubuntu 20.4 with libclang1-10
