Hi,

Today I installed UPP ver 16497, Ubuntu 20.04,  
Comparing behavior with ver 16270

Checking with Examples/GeoFun

I even checked with fresh install of ubuntu 20.04. I initially thought that I have some problem with  
llvm/clang. clang version is 10.

When I "Ctrl+Left Click" on line 735 "CtrlLayout" it will open Function def file properly.  
But same action on line 739 nothing happens. Similarly it won't open definition of "Icon" line 737.

InputPane is derived from Layout. click on any line containing InputPane nothing happens.

Whereas it opens layout file with ide ver 16270 with proper highlight.

I am not sure if it is a bug or something related to my install.

Auto complete is working properly.
