Not sure if this problem is unique to me: on Ubuntu 22.10+UPP.16512 (and some other recent versions),  
"Find..." function cannot be used. Ctrl+F, type in string to search, won't work.

Another problem. Add new help topic will crash TheIDE. For a test,  
\* open "examples/AddressBook", navigate to "AddressBook.cpp" if not already in it.  
\* In the class "AddressBook", click any member variable or function to add cocumentation [a cyan square to the left of the function/variable line];  
\* in the popup menu, choose "New reference topic"  
\* in the "New Topic" dialog, in the Template field, change it to "Reference-en\_us (in uppsrc)"  
\* Click "OK" button

The ide crash with invalid memory access.

I am sorry. I know Mirek has been tirelessly working on integrating libclang to theide. Not criticizing, not meaning to distract, just trying to bring awareness.
